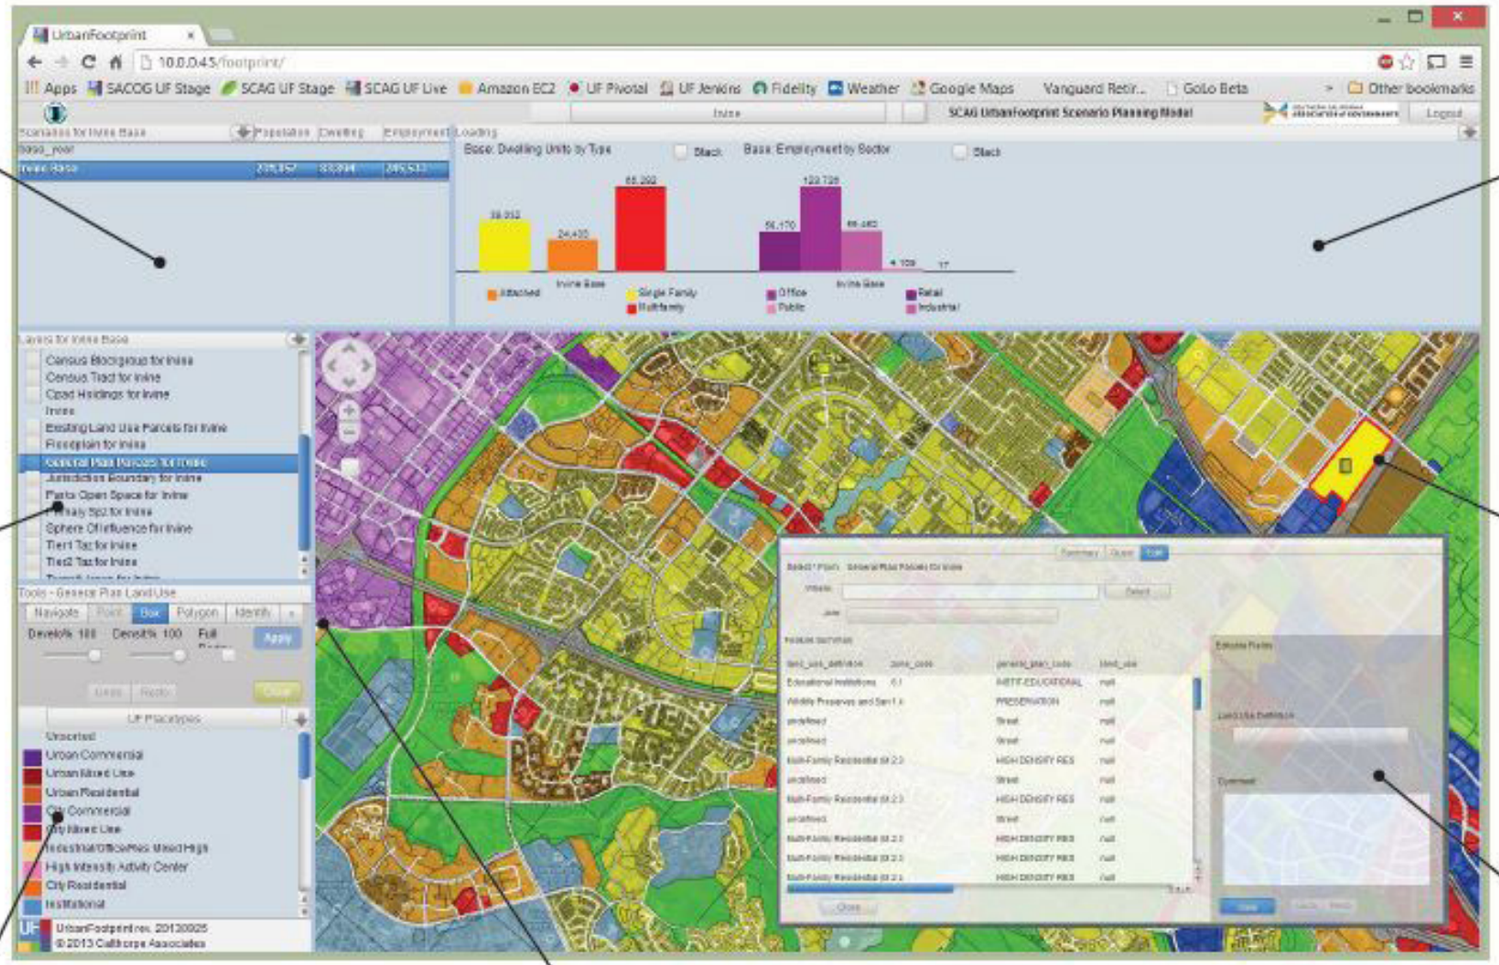
Project/Scenarios

For the pilot, this area lists the 2012 base year as the single project or scenario available to the user. It also displays top-level data about the project area (in this case, the City of Irrvine), including 2012 population, dwelling units, and employment for the jurisdiction. For scenario development, this area will include all scenarios being developed and/or analyzed.



Charts

For the pilot, this area contains basic statistics for the jurisdiction (population, dwelling units, and employment) in the 2012 base year. This area will also serve as the home of scenario statistics and analytical results once that functionality is fully integrated into the web interface.

Layers

This section displays layers that have been preloaded into the Scenario Planning Model, and that can be turned on for display and activated for selection, editing, and queries. Functionality that allows a user to customize layer symbology, colors, and ordering, as well as import and export capability, is in development.

Map Area

This is where all map layers are displayed and where the user makes selections and queries data with tools.

Bulit Forms

This area includes the color-coded list of land use types used to display the 2012 Primary Parcel layer and General Plan layer. The categores and colors are consistent with those used by SCAG in its common/regional land use codes and designations. This area is also where users will view, select, and apply place and building types in the development of future land sue scenarios at the regional or local scale.

Info Window

Info windows allow the user to view, query, and in some cases edit or comment upon select layer attributes.

Tools

These tools allow the user to navigate around the map, as well as select and identify map features. It is also where scenario development tools will be located when such functionality is integrated into the web interface.
